5.4.3 Function Documentation

5.4.3.1 `regex_t * fcal::scanner::make_regex (const char * pattern)`

5.4.3.2 `int fcal::scanner::match_regex (regex_t * re, const char * text)`

5.4.3.3 `char * fcal::scanner::ReadInput (int argc, char ** argv)`

[ReadInput\(\)](#) - Read a file into a char buffer. The calling function is responsible for disposing of the return memory.

RETURN: char* - The buffer, or NULL if an error occurred.

5.4.3.4 `char * fcal::scanner::ReadInputFromFile (const char * filename)`

[ReadInputFromFile\(\)](#) - Do the actual reading of the file into the buffer

RETURN: char* - The buffer, or NULL if an error occurred.

6.49.1 Detailed Description

The [Parser](#) class is used to parse a Token list generated by the scanner into an AST that represents the syntax of the productions in the FCAL language. Most of the parse functions are split up by production type (Program, Stmts, Stmt, Decl, and Expr) and use sequential token matching and the classes from [ast.h](#) to build the AST and make sure it is grammatically correct. The code that we changed in iteration 3 involved updating the code to produce the AST using the newly created [ast.h](#) classes.

6.56.1 Detailed Description

The [Scanner](#) class is used to scan an FCAL program (inputted as a character string) for tokens and send them to a parser. The Scan function is the main component of this class; it does all of the regex matching to determine the next token in the program and creates a [Token](#) object list to be returned. This function uses an array of regex_t regular expressions (which correspond to FCAL language tokens) for token matching.
